

INDUSTRIAL FITTINGS - couplings

Emergency couplings - SBC

- Material:** Aluminium, brass, AISI 316
- Seals:** Viton - O-ring
PTFE - flat seal of the connection side (other also available)
- Connections:** As a standard: BSP or NPT thread, PN EN1092-1, ANSI B16.5 or TTMA flanges (other also available)
- Working press.:** 25 bar (optionally 40 bar)
- Working temp.:** From -25°C up to +80°C (the acceptable working temperature ranges from -54°C up to +250°C for proper coupling material and seals, after written confirmation for application with a particular medium from the manufacturer).

Operation

A coupling designed to transmit a load of a strained hose to breaking bolts. The bolts are broken before the hose and its fittings collapse. The coupling disconnects. Simultaneously spring valves in both coupling halves lock, so the transferred medium is not released to the atmosphere. The coupling contains three breaking pins. After emergency situation which caused disconnection of the coupling and breaking of bolts, the coupling can be easily connected using a new set of bolts. However before it is reused, the coupling always requires thorough inspection. The breaking load can be set at a lower level, accordingly, the maximum working pressure is lower as well. The seal made of EPDM, NBR, Chemraz or Kalrez is also available.

Application

Emergency couplings are used in industrial installations and reloading systems, to handle chemicals, fuels and gases.

Standards

The couplings meet the requirements of ATEX, ADR, RID, IMDG, Pressure Equipment Directive 97/23/EC (PED).

INDUSTRIAL SBC	MARINE SBC
<p>The couplings disconnect at an angle ranging from 0° to 90°. The coupling is assembled on the installation at one end, and hose assembly at the other.</p>	<p>The coupling is disconnected by a straight (0°) pull only. Any bending of the coupling is not transmitted to the breaking bolts. The coupling is assembled between two hose lengths.</p>

 Viscosity: 1.75 mm²/s

INDUSTRIAL FITTINGS - couplings

Emergency couplings - ABV

Material: SS (AISI 316 / AISI 316Ti),
SS/ECTFE, Al

Seal: Viton - O-ring
PTFE - for SS couplings,
PUR - for Al couplings
(other also available)

Connections: BSP female thread

Working press.: 16 bar (10 bar for Al)

Working temp.: From -40°C up to +150°C (for SS)
From -40°C up to +60°C (for Al)

Operation

A coupling designed to transmit a load of a strained hose to breaking bolts. The bolts are broken before the hose and its fittings collapse. The coupling disconnects. Simultaneously spring valves in both coupling halves lock so the transferred medium is not released to the atmosphere. The coupling contains three breaking pins that ensure even distribution of axial load. If the load is lateral, the coupling disconnects earlier. The lateral deflection of the force straining the hose from the coupling axis must not exceed 90°. After emergency situation which caused disconnection of the coupling and breaking of bolts, the coupling can be easily connected using a new set of bolts. However before it is reused, the coupling always requires meticulous inspection.

Application

ABV emergency couplings are used in industrial installations and reloading systems, to handle chemicals, fuels and gases.

Standards

Compliant with the Pressure Equipment Directive (CE marking) and the ATEX Directive for operation in potentially explosive atmospheres, zone 1.

Axial force (P) breaking a coupling without pressure

DN [mm]	25	50	80	100
P [kG]	320	1000	2000	2800

Pressure drop in ABV and ABV-S couplings

Test parameters:

Medium: water
Temperature: +20°C
DIN EN 60534-2-3

Resistance of a flexible hose assembly (a hose with fittings) to axial mechanical load must be at least 1.3 times bigger than the force breaking a coupling.

INDUSTRIAL FITTINGS - couplings

Emergency couplings - ABV-S

Material: SS (AISI 316 / AISI 316Ti),
SS/ECTFE

Seal: Viton - O-ring
PTFE - for SS couplings
(other also available)

Connections: BSP female thread
DIN PN10/16 or ASA 150 flanges

Working press.: 25 bar

Working temp.: From -40°C up to +150°C
(working temperature depends on seal
and coupling material)

Operation

A coupling with a cable activates disconnection when a hose assembly connected to a tank truck is pulled. At the same time the cable fixed to the coupling at one end and at the other to a rigid point on the installation is strained (the cable is shorter than the flexible hose assembly). The coupling disconnects. Simultaneously spring valves in both coupling halves lock so the transferred medium is not discharged to the atmosphere. The coupling has three levers that connect coupling halves. The levers are released when the strain of the cable achieves pre-determined limit. The lateral deflection of the force straining the cable from the coupling axis must not exceed 90°. After emergency situation which caused disconnection of the coupling, the coupling can be connected once again. However before it is reused, the coupling always requires thorough inspection.

Application

ABV-S emergency couplings are used in industrial installations and reloading systems, to handle chemicals, fuels and gases. Compared to ABV couplings with breaking bolts, ABV-S couplings are more adjustable so can be activated with little force. Thus they can be used on installations that cannot handle excessive loads. When compared: ABV DN 50 coupling activates at 7.8 kN (pressure: 16 bar, angle: 0°), whereas ABV-S DN 50 at 0.3 kN (pressure: 25 bar, angle: 0°).

Standards

Compliant with the Pressure Equipment Directive (CE marking) and the ATEX Directive for operation in potentially explosive atmospheres, zone 1.

**Force (P) that strains a cable
and causes coupling disconnection
at 25 bar:**

INDUSTRIAL FITTINGS - couplings

Emergency couplings - ABVL

Material: SS (AISI 316Ti / AISI 316), Al
Seal: O-ring: Viton (options: NBR, EPDM, Kalrez)
 Flat seal: PTFE
Connections: Standard - BSP female thread
 Options - NPT female thread, BSP male thread, EN 1092, ASME flanges, weld-in ends
Size: DN50, DN80, DN100, DN150
Working press.: 25 bar
Working temp.: From -40°C up to +150°C

Operation

ABVL emergency coupling is an upgraded version of ABV coupling. The coupling protects against consequences of accidental, excessive strain of a hose assembly connected to an installation e.g. during reloading, when a tank truck rolls away and the hose is still connected. Before the hose is strained so much that it breaks or the fittings are torn off, the bolts joining both halves are broken so that the coupling disconnects. Simultaneously the valves in both coupling halves lock so the transferred medium is not released to the atmosphere. If the load is lateral, the coupling disconnects earlier. The lateral deflection of the force straining the hose from the coupling axis must not exceed 90°. The main advantage of ABVL couplings over ABV couplings is low pressure loss at high flow rates obtained by the valves of special, streamlined construction.

Application

ABVL emergency couplings are used in industrial installations and reloading systems, to handle chemicals, fuels and gases.

Standards:

Compliant with the Pressure Equipment Directive (CE marking) and the ATEX Directive for operation in potentially explosive atmospheres.

Axial force (P) breaking a coupling

DN [mm]	coupling break force [kN] - 0 bar	coupling break force [kN] - 16 bar	recommend. hose break force [kN]
50	12	8.8	16
80	22	14.7	30
100	30	19.5	40
150	60	38.6	80

Comparison of pressure drop in ABVL/ASVL and ABV/ABV-S emergency couplings

Test parameters: medium water, temperature +20°C.

INDUSTRIAL FITTINGS - couplings

Emergency couplings - ASVL

Material: SS (AISI 316Ti / AISI 316)
Seal: O-ring: Viton (options: NBR, EPDM, Kalrez)
 Flat seal: PTFE
Connections: Standard - BSP female thread
 Option - NPT female thread, BSP male thread, EN 1092, ASME flanges
Size: DN50, DN80, DN100, DN150, DN200
Working press.: 25 bar
Working temp.: From -40°C up to +150°C

Operation

ASVL emergency coupling is an upgraded version of ABV-S coupling. The coupling protect against consequences of accidental, excessive strain of a hose assembly connected to an installation e.g. during reloading, when a tank truck rolls away and the hose is still connected. When any displacement of a coupling connected to a tank truck occurs, the cable fixed to the coupling at one end and at the other to a rigid point on the installation is strained (the cable is shorter than the flexible hose assembly). The cable activates disconnection process. Simultaneously spring valves in both coupling halves lock, so the transferred medium is not discharged to the atmosphere. The coupling has three levers that connect coupling halves. The levers are released when the strain of the cable achieves pre-determined limit. The lateral deflection of the force straining the cable from the coupling axis must not exceed 90°. After emergency situation which caused disconnection of the coupling, the coupling can be connected again. However before it is reused, the coupling always requires thorough inspection. The main advantage of ASVL couplings over ABV-S couplings is low pressure loss at high flow rates obtained by the valves of special, streamlined construction.

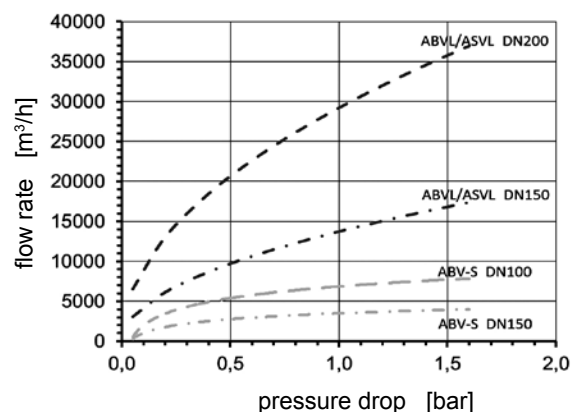

Application

ASVL emergency couplings are used in industrial installations and reloading systems, to handle chemicals, fuels and gases.

Standards:

Compliant with the Pressure Equipment Directive (CE marking) and the ATEX Directive for operation in potentially explosive atmospheres.

Comparison of pressure drop in ABVL/ASVL and ABV/ABV-S emergency couplings

Test parameters: medium water, temperature +20°C.

INDUSTRIAL FITTINGS - couplings

Emergency couplings - KLAW

Material:	Stainless steel, carbon steel, aluminium
Seal:	Viton, PTFE
Connections:	BSP or BSPT thread, flanges, weld-in connectors
Sizes:	From 1" to 12"
Working press.:	Up to 40 bar (depends on a size)

Operation

KLAW emergency couplings protect against consequences of accidental, excessive strain of a flexible hose assembly connected to an installation. The coupling with breaking pins is designed to transmit the load of the strained hose to the pre-determined breaking bolts. The bolts are broken before the hose and its fittings collapse. The coupling disconnects. Simultaneously flap valves (Flip-Flap) in both coupling halves lock so the transferred medium is not released to the atmosphere. The coupling contains three breaking pins that ensure even distribution of axial load. If the load is lateral, the coupling disconnects earlier. The lateral deflection of the force straining the hose from the coupling axis must not exceed 90°. After emergency situation which caused disconnection of the coupling and breakage of bolts, the coupling can be easily connected using a new set of bolts. However before it is reused, the coupling always requires meticulous inspection.

Available versions:

- MARINE - reloading in marine applications, assembled between two hose lengths,
- ERC - coupling with a cable, used with loading arms and other applications
- CRYOGENIC - for cryogenic media (down to -196°C - LNG, liquid oxygen, ethylene, propylene, ethane).

Application

KLAW emergency couplings are used in industrial installations and reloading systems, to handle chemicals, fuels and gases.

Standards

Compliant with the Pressure Equipment Directive (CE marking) and the ATEX Directive for operation in potentially explosive atmospheres, zone 1.
